

STATSCON

The STATSCON utility consolidates one or more statistics files into a single file with only the most recent statistics records for each request. The output file can be created in the standard client or server statistics record format or as a CSV file.

The general syntax to start the STATSCON program from TACL is

```
tacl> run STATSCON / run-options / [ command-line-parameters ]
```

run-options

The standard TACL run options.

command-line-parameters

-infile <command-file>

An input file specification that selects the input statistics file or files. The specification can contain wildcard characters to allow the selection of multiple files. *This parameter is required.*

-outfile <file name> [!]

The consolidated output file name. If the file already exists, specify the '!' option to indicate that the existing file should be overwritten. *This parameter is required.*

-outformat < record | CSV >

The desired output format. This parameter is optional and if not specified, "record" is the default.

-help

Displays documentation for the program command line options.

Remarks

If the input specification selects both client and server statistics files an error will be returned.

Examples

```
tacl> run STATSCON -infile zzsstats -outfile statsout !
```

```
tacl> run STATSCON -infile zzsst* -outfile sstats ! -outformat csv
```
