

Administrator's Guide

The SOAPam Server Administrator has two main areas of responsibility: NonStop Server administration and SOAPam Server administration. NonStop Server administration for SOAPam Server largely entails the initial installation and performing basic configuration required to start the SOAPam Server process and is performed through the NonStop Server TACL interface. Once the server is up and running, all other administration tasks are performed through the browser-based SOAPam Control Panel application:

NonStop Server Administration Tasks

- SOAPam Server Installation
- Starting the SOAPam Server process
- Backing up the Virtual File System

Typical SOAPam Server Administration Tasks

- Managing groups and users
- Setting VFS Folder Permissions
- Installing Certificates

Refer to the appropriate subsections for more information.
