

Upgrade Considerations

- When upgrading from a previous release the filesystem update procedure must be performed. See [Updating LightWave Server](#) for more information.
- The SUTILITY program has been deprecated. All CLI based product management should be done using LWSCOM.
- The installation and upgrade procedures have been updated to use LWSCOM.
- This release adds support for TLS v1.3 and by default disables all TLS versions prior to TLS v1.2. If your application requires earlier TLS versions, use the `--tls-protocols` option to enable the required protocols.
