

# File System Browser

The File System Browser provides access to the Virtual File System. The browser includes functionality similar to Window or Linux file system browsers and is used primarily to manage Service Definition (SDF) files and manage log files. The context menu for SDF files provides quick access to service management features such as Documentation, Diagnostics, and the Service Definition Wizard.

Note that the /system folder is reserved for SOAPam Server file storage. Do not modify the contents of this folder or any of its subfolders.
